

#	Ticket	Component	Test ID
1	GAAM-1358 (see GAAM-397 AC)	Site Header / Main Nav	NVGT-066
2	GAAM-675 (Sprint 13 Padding)	Text	GAAM-675-003, GAAM-675-011
3	(no ticket — found incidentally)	Site Header	SH-054

Summary

Once a role is selected (e.g. Financial Professional), the site header does not stick to the top of the viewport on scroll — it stays `position:static` and scrolls off-screen.

Text component (`.cmp-text`) padding is `0px 20px` on desktop but drops to `0px` (all sides) on mobile (375px) — no horizontal padding at all on small viewports.

At tablet width (1024px), `.cmp-site-header`'s internal `scrollWidth` (949px) exceeds its `clientWidth` (874px) by ~ 75 px.

Evidence	Confidence
On /content/global-atlantic/financial-professionals/main/en.html, dismissed the first-visit consent modal, scrolled 900px: header position stayed "static", getBoundingClientRect().top went to -75 (scrolled fully off top). Now encoded as a real (currently failing) assertion in navigation.author.spec.ts — will auto-pass once fixed.	High
Confirmed on the deployed text fixture page: desktop padding: 0px 20px, same element at 375px width padding: 0px. Parent .aem-GridColumn also has 0px padding at both widths, so nothing upstream compensates.	Medium
Measured directly; however no descendant element's bounding box actually exceeds the visible viewport (offenders: []) — no real horizontal scrollbar appears. The adjacent GAAM-397 AC text explicitly scopes Site Header to "desktop breakpoints only," with mobile deferred to GAAM-393 — tablet isn't a committed target.	Low

Confidence Notes

Directly reproduced, matches ticket's reported symptom exactly.

Real, reproducible CSS behavior, but unconfirmed whether zero mobile padding is intentional (page-level gutter elsewhere) or a regression. Needs design/PM confirmation. Likely benign internal box-model quirk, not a user-visible bug. Included for completeness.
